Miniquiz #22

5 Minutes

1. Using the left snippet of mitscript, generate x86 assembly code to the right. Assume the caller used `%rdi` to pass the argument's value to the function, `%rax` for the return value, `%rsp` for the stack pointer and `%rbp` for the base pointer.

```
fun(x) {  
    y = x + 7;  
    return y * 2;  
}
```

```
_function1:  
  
    push    %rbp  
    mov     %rsp, %rbp  
    sub     $8, %rsp  
  
    mov     $7, %rax  
    add     %rdi, %rax  
    mov     %rax, -8(%rbp)  
  
    mov     -8(%rbp), %rax  
    mul     $2, %rax  
  
    mov     %rbp, %rsp  
    pop     %rbp  
    ret
```
